Download qalV1.tar.gz from sftp

Import the image:

```
docker load < qalV1.tar.gz
```

Run a container with:

```
docker run -d -p  127.0.0.1:4545:4545/tcp  qal:1.0
```

QAL is listening on port 4545 via an REST API.

Run a Proteus instance so that QAL can fetch tables.

Check jupyter notebook to find the REST API instruction and some test queries.
